

Energy and Carbon emission reduction with Energy & Decarbonization Assessments

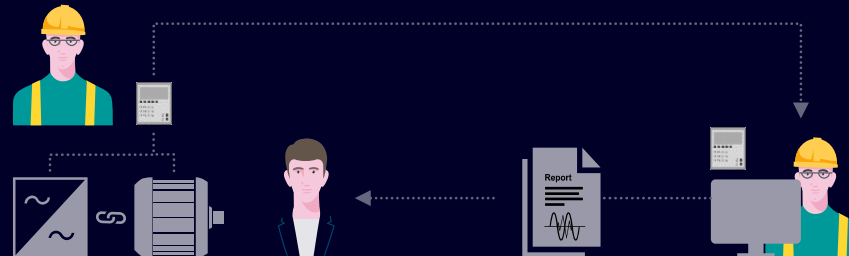

Energy & Decarbonization Assessments

- Customers want to reduce their operational costs
- To reduce energy consumption
- They also want to reduce their carbon emissions/footprint
- To do this they need to fully understand their factories and processes to learn where there are areas for improvements

How does it work?

- Our expert engineers will conduct auditing activities for the customer
- This will involve a review of their processes, on site measurement of running equipment and producing a comprehensive report
- Whilst on site the auditing team may suggest trialing new conditions to improve a process
- The report highlights areas of weakness in their processes
